## Selected Research Projects

- 2023 **Composing Distributed Computations Through Task and Kernel Fusion** with Michael Bauer, Shiv Sundram, Wonchan Lee, Michael Garland, Alex Aiken, Fredrik Kjolstad  
Developed dynamic program analysis techniques to fuse computations across library boundaries on distributed machines, enabling applications built through the composition of high-level libraries to approach the performance of hand-written code.
- 2022 **Legate Sparse** with Michael Bauer, Wonchan Lee, Manolis Papadakis, Melih Elibol, Michael Garland  
Developing `legate.sparse` a distributed and GPU-accelerated drop-in replacement for `scipy.sparse`, enabling supercomputer scale performance from high-level Python code.
- 2021–2022 **Compiling Tensor Computations to Supercomputers** with Fred Kjolstad, Alex Aiken  
Developed DISTAL, a compiler for sparse and dense tensor algebra that targets distributed systems.
- 2020 **Automated Mapping of Computation and Data** with Alexandra Henzinger, Thiago Teixeira, Alex Aiken  
Developed system to automatically discover strategies for mapping computation and data onto different processors and memories in a heterogeneous system.
- 2018–2019 **Disentanglement** with Sam Westrick, Umut Acar  
Designed efficient memory management systems for the memory access patterns of fork-join parallel programs.
